## Scoring and interpretation

Each item can get a score of 0 if options 1 or 2 are chosen or 1 if options 3 and 4 are selected, getting from its sum a total score ranging from 0 to 12.

The cut-off point set for the general population was 3, considering those subjects with scores greater than or equal to 3 are more prone to potential psychiatric morbidity cases.

Higher scores indicate a greater likelihood of health issues. They may also suggest the need for further assessment or intervention.
