

Rent Test

Patient information

Name:

Age:

Date of examination:

Test procedure

- Positioning of patient:** Ensure the patient's arm is relaxed at their side; note any initial discomfort.
- Palpation:** Begin by palpating the shoulder area to locate the supraspinatus tendon; note any initial findings such as tenderness or gaps.
- Manipulation:** Instruct the patient to rotate their arm internally and externally. Carefully observe any changes in pain or detectable defects in the tendon area.
- Observations:** Record any pain response, palpable gaps, or other abnormalities detected during manipulation. Look for the presence of a palpable or prominent eminence (Greater tuberosity) and/or rent (defect or 'sulcus') which indicates a full-thickness tear.
