Scratch Collapse Test (SCT)

Name:	Age:
Medical record number:	Date of visit:
Procedure	
Flocedule	
 Positioning The patient sits facing the examiner, arms adducted, and wrists in a neutral position. Instruction 	elbows flexed to 90 degrees, and hands
Instruct patient to resist bilateral shoulder adduction/internal rotation applied by gently pushing both forearms.3. Stimulus	
Scratch or swipe the skin surface over the suspected nerve compression site. 4. Observation	
Immediately observe for any loss of muscle resistance or arm collapse. 5. Interpretation	
Note whether the test is positive or negative based on observed response.	
Findings	
SCT result:	
 Positive: Patient's ability to resist force is briefly reduced or collapses after scratch/swipe Negative: No reduction in resistance 	
Affected nerve:	
Specify if known	
Clinical correlation:	
Discuss how findings correlate with patient's symptoms and history	

Notes / recommendations
