Integrated regulation:							
Identified regulation:							
Introjected regulation:							
External regulation:							
Non-regulation/Amotivation:							

## **Scoring**

You can score the SMS-II by either totaling the responses or averaging them, depending on your analysis needs.

- **Total score:** Add up all the item scores to get a total score. This gives a comprehensive view of the overall motivation level.
- Average score: Alternatively, you can calculate the average score by dividing the total score by the number of items (18). This method normalizes the score, making it easier to compare across different scales or populations.

To calculate the scores for each subscale, sum the scores of the corresponding items and get the average score for each subscale:

• Intrinsic regulation: Items 3, 9, 17

• Integrated regulation: Items 4, 11, 14

• Identified regulation: Items 6, 12, 18

• Introjected regulation: Items 1, 7, 16

• External regulation: Items 5, 8, 15

• Non-regulation/Amotivation: Items 2, 10, 13
