Test overview
The Supine Roll Test is a diagnostic maneuver used to identify horizontal canal benign paroxysmal positional vertigo (HC-BPPV).
Instructions for the patient
 Wear comfortable clothing that allows clear visibility of the neck and head. Lie on your back with your head slightly elevated (approximately 20 degrees). Follow the clinician's instructions carefully during the test.
Test procedure
 Have the patient sit lengthwise on the examination table and place Frenzel/VNG goggles on the patient. Guide the patient into a supine position with a slight elevation of the head (~20 degrees). Instruct the patient to turn their head 90 degrees to the right. If cervical flexibility is limited, have them roll onto their shoulder. Observe for nystagmus and note its severity and direction. Return the patient's head to a neutral position. Repeat the head turn to the left and observe for nystagmus again. Return the patient to the neutral position.
Results
Right head turn
Nystagmus: [] Present [] Absent
Severity of nystagmus:
Direction of nystagmus: [] Geotropic [] Apogeotropic
Left head turn
Nystagmus: [] Present [] Absent
Severity of nystagmus:
Direction of nystagmus: [] Geotropic [] Apogeotropic
